

Individual Project Proposal

Project Summary

I will be building a phone application. I want to learn how to make games for phones, so I decided to make a choose your own adventure game. I wanted to make a game that was fun and easy to play. Since I haven't worked that much with javascript and angular I'm hoping this project will help me learn the fundamentals needed for building applications with angular. The purpose of the game is for an individual to go through a story and along the way get asked questions, that depending on their answer, will determine the outcome of the story.

Current Project Status

I will be starting this project from scratch. I do already have a pretty good idea what the choose your own adventure story is going to be though.

Proposed Technologies

I want to build this app in the ionic framework, using angular js. I will also be using photoshop and indesign for creating the graphics for my game.

Specific Project Deliverables

What I will be accomplish for this project is a design layout of the app. This is so I can get I feel for how the app should look and feel before I start coding it. I want to incorporate transitions into my app everytime you make a choice. I think it would also be fun to have some animations when you win or lose. I want to make it so my app can run offline. Also since I'll be using angular, my app won't have to send lots of http requests which will make it run faster.
